

Amendments to Specification:

Please replace the paragraph beginning at page 19, Line 9 with the following paragraph:

Mechanisms may also be provided for tracking which interfaces may talk to which other interfaces. For example, a domain, such as cnn.com, may wish to only access other computer on the Internet and not other private networks. In contrast, a particular ~~private~~ private domain may wish to communicate with one or more other private domains. In other words, groupings may be set up to allow specific domains to communicate with other specific domains. These groupings (herein referred to as NAT Virtual Interfaces (NVI's)) may be implemented in any suitable manner.
